

High Pressure Equipment

Technical Information

Selecting the right product to plumb your pressure system or conduct your research project is a critical decision. In this section, High Pressure Equipment Company provides a variety of technical information to assist you in this selection process. We have included a number of English to Metric conversion charts, flow coefficient formulas and valve ratings, reactor pressure ratings, and recommended torque values for our air operated valves and tubing connections.

As you work with this data, it is important to consider that it is general in nature and may vary depending on the actual parameters of your application. If you have any questions concerning this information or would like assistance in selecting an HiP product, our engineering staff is available and ready to help.

Flow Coefficients

The flow coefficient Cv is a valve sizing designation commonly determined by laboratory test. It corresponds to the flow rate of water through a valve in US gallons per minute at 60°F with a differential pressure drop of one psi.

Flow coefficients of various HiP valves

With the Cv coefficient known, the following values can be calculated:

1. Liquid flow capacity in US gallons per minute

$$Q_l = C_v \cdot \sqrt{\frac{\Delta P}{G}}$$

2. Pressure drop across valve (liquid flow)

$$\Delta P = G \cdot \frac{Q_l^2}{C_v^2}$$

3. Gas flow capacity in standard cubic feet per hour (SCFH)

$$Q_g = 1360 \cdot C_v \cdot \sqrt{\frac{P \cdot \Delta P}{T \cdot G \cdot Z}}$$

4. Pressure drop across valve (gas flow)

$$\Delta P = \frac{T \cdot G \cdot Z}{P} \cdot \left(\frac{Q_g}{1360 \cdot C_v} \right)^2$$

Where:

C_v = Valve flow coefficient

G = Specific gravity of fluid

ΔP = Differential pressure drop across valve (psi)

P = System pressure at valve inlet (psia)

Q_l = Liquid flow in US gallons per minute (GPM)

Q_g = Gas flow in standard cubic feet per hour (SCFH)

T = System temperature (°R)

Z = Gas compressibility factor at operating conditions
